PROCool Electronic Panel

User manual
AKO Electromecànica reserves the right to make any modification to the documentation and the product without prior notification.

In order to extend the lifetime of our products to the maximum, the following points must be observed:

- Regulations. Rigorously follow the instructions described in this manual.
- Only qualified personnel may install the product or carry out technical support.
- Do not subject equipment to knocks or vibrations or attempt to handle them in any way differently to that indicated in the manual.
- Respect the indicated environmental conditions for operation and storage at all times.
- During installation and on completion of this, avoid the presence of loose, broken or unprotected cables or cables in poor condition. These may constitute a risk for the equipment and its users.
- Do not expose electronic equipment to dust, dirt, water, rain, moisture, high temperatures, chemical agents or corrosive substances of any type.

Our commitment to achieving customer satisfaction and our continuous efforts to improve day by day are confirmed by the various quality certificates obtained.

This is a high performance, technologically advanced product. Its operation and the final performance achieved will depend, to a great extent, on correct planning, installation, configuration and commissioning. Please read this manual carefully before proceeding to install it and respect the instructions in the manual at all times.

This product has been developed for use in the applications described in the manual. AKO Electromecànica does not guarantee its operation in any use not foreseen in this document and accepts no liability in the case of damage of any type which may result from incorrect use, configuration, installation or commissioning.

Complying with and enforcing the regulations applying to installations where our products are destined to be used is the responsibility of the installer and the customer. AKO Electromecànica accepts no liability for damage which may occur due to failure to comply with these regulations. Rigorously follow the instructions described in this manual.

In order to extend the lifetime of our products to the maximum, the following points must be observed:

- Do not expose electronic equipment to dust, dirt, water, rain, moisture, high temperatures, chemical agents or corrosive substances of any type.
- Do not subject equipment to knocks or vibrations or attempt to handle them in any way differently to that indicated in the manual.
- Do not under any circumstances exceed the specifications and limitations indicated in the manual.
- Respect the indicated environmental conditions for operation and storage at all times.
- During installation and on completion of this, avoid the presence of loose, broken or unprotected cables or cables in poor condition. These may constitute a risk for the equipment and its users.

AKO Electromecànica reserves the right to make any modification to the documentation and the product without prior notification.

AKO Electromecànica thanks you and congratulates you on the purchase of our product, the development and manufacture of which involved the most innovative technologies, as well as rigorous production and quality control processes.
1.- Presentation

**PROCool** is the comprehensive electronic solution for managing both positive and negative refrigerated facilities.

- Rapid start-up thanks to its quick programming menu.
- Large format display for better viewing.
- Hot keys for the most frequently used functions.

It has a high level of IP65 protection for installation in humid environments.

1.1.- Maintenance

Clean the surface of the unit with a soft cloth, water and detergent. Do not use abrasive detergents, petrol, white spirits or solvents.

1.2.- Precautions

Using the equipment without following the manufacturer’s instructions may affect the device’s safety requirements. To ensure that the device operates correctly, only probes supplied by AKO should be used.

Between -40 °C and +20 °C, if the NTC probe is extended up to 1,000 m with minimum 0.5 mm² wire, the maximum deviation will be 0.25 °C (Wire for probe extension ref. AKO-15586)

**IMPORTANT:**

- The function of the digital inputs depends on the configuration (See page 22).
- The recommended currents and powers are the maximum working currents and powers.

**Max C:** Maximum current allowed; the aggregated compressor and fan consumption (evaporator + condensers) cannot exceed this value.

** For 230 V III power supply, they must be connected exactly as shown in the installation diagram appearing in the panel.
3. - Recommendations

Disconnect the voltage before carrying out any operations inside the electrical panel. All wiring should be according to current standards and should be carried out by authorised staff. Only carry out the wiring foreseen in the wiring diagrams. Using the electrical panel not observing the manufacturer’s instructions may alter the appliance’s safety requirements. A tool is needed to remove any fixed part.

Panel installation:
It is advisable to leave a clean safety space without obstacles around the panel.
Do not knock or make sudden movements on the panel.
Carry out the wiring according to the installation manual.
The probes and their cables should NEVER be installed in a conduit together with power, control or feeder cables.
The earth terminals that the panels contain are installed to guarantee the continuity of earthing, however, earthing is not carried out by the terminal and should be carried out outside the panel.
The neutral ratings are of the TT type. The IT rating should not be used.
Circuit breakers (protective switches) are of the phase/s + neutral, curve C type, guaranteeing switching and protection against overcurrents.
Close the panel when you are not working on it.
Residual current protection outside the electrical panel according to low voltage electrotechnical regulations.
The panels comply with European Standards EN 61439-1 and EN-61439-2 for the electrical panel and EN-60730 for the control board.
Terminals for copper external conductors.

Checks before starting the panel up:
Power supply voltages and frequencies will be the ones that figure in the "Technical specifications" section.
Check that there are no loose parts or foreign bodies on connections or switchgear.
Check that there is no dust or damp inside the panel.
Check the correct fastening of the switchgear and components.
Check the correct tightening of the screws and power connections.
Check the correct connection of the power conductors.
Check the correct insulation of the outer lines and that they do not mechanically force the inner connections of the panel.
Check that the maximum current of the FK1, FK2 and FK3 motor guards has been set correctly (depending on the model).
Before starting the installation up, we recommend preheating the compressor’s housing.

Checks during the panel start-up:
Check that no electric arcs occur.
Check that the relays or contactors do not produce ratios.
Check that there is no overheating in cables, controllers and the rest of the switchgear.

Checks after the first 24 hours of operation:
Check that no overheating occurs.
Retighten screws and power connections.

Periodical preventive maintenance:
The panel should remain closed using its lock.
Retighten the power connections once a year.
Check the wear of the switchgear once a year.
Clean the outer surface of the panel with a soft cloth, water and detergent. Do not use abrasive detergents, petrol, white spirits or solvents.

Technical data:
Working ambient temperature: –5 ºC to 40 ºC
Rated isolation voltage Ui = 440 V~
Electrical panels with degree of protection: IP 65
CEM B environment
Terminals for copper conductors
Resistance to short-circuits Icc=6 kA
Rated pulse voltage (Vimp) 2,5 KV

Cable isolation voltage:
Operation: 500V (Halogen free)
Power: 750V (Halogen free)
4.- Description

- Stand-by active mode
- Alarm active
- Compressor active (if \( P26 = 1 \))
- Condenser fans active
- Defrosting in progress
- Evaporator fans active
- Solenoid active

Display

Stand-by key

Defrost key

Set Point key

Menu key

4.1.- Key function

Pressing it for 5 seconds activates the Stand-By mode. Pressing it for 2 seconds the unit returns to the normal mode. In Stand-by mode, the unit performs no action and the display only shows the \( \emptyset \) indicator along with the temperature.

During configuration, it exits the parameter without saving changes, returns to previous level, or exits programming.

One short press* shows the non-displayed probe reading (see \( P8 \) parameter).

Pressing it for 5 seconds starts/stops the defrost. During configuration, it allows you to scroll through the different levels, or when setting a parameter, to change its value.

Pressing for 5 seconds accesses the quick configuration menu. Pressing for 10 seconds accesses the advanced configuration menu.

During configuration, it allows you to scroll through the different levels, or when setting a parameter, to change its value.

One short press* displays the current set point value (SP). Pressing it for 5 seconds accesses change set point.

During configuration, it accesses the level shown on the display or, when setting a parameter, it accepts the new value.

*Short press: Less than 5 seconds.
### 4.2- Messages

</table>
5.- Component location

**ATTENTION:** Make sure to turn off the equipment’s power supply before handling it, as different areas may be energised.

**IMPORTANT:** The availability of the elements described depends on the panel model.

**AKO-17632, AKO-17635, AKO-17520, AKO-17521**

![Component diagram]

**Identification**

- **F1:** General circuit-breaker
- **FM:** Operation circuit breaker
- **FK1:** Compressor motor guard + condenser fan 1 (depending on model)
- **K1M:** Compressor contactor
- **K4M:** Defrost contactor
Identification

**F1:** General circuit-breaker  
**FM:** Operation circuit breaker  
**FK1:** Compressor motor guard + condenser fan 1 (depending on model)  
**FK2:** Evaporator fan motor guard  
**FK3:** Condenser fan motor guard  
**K1M:** Compressor contactor  
**K2M:** Evaporator fan contactor  
**K3M:** Contactor for Condenser fan 2  
**K4M:** Defrost contactor  
**K5M:** Contactor for Condenser fan 1
6.- Quick configuration

The quick configuration menu allows the unit to be configured for the most common applications. Press the \( \text{key} \) for 5 seconds to access it.

If the access code is activated, a 2 digit code is requested (See p. 16), if the code entered is not correct the unit will not enter programming.

If more specific configuration is required use the advanced configuration menu (see p. 18)

After 20 seconds without touching any key, the unit returns to the previous level without saving changes or it will exit programming.

**Function of the keys in programming**

\[ \text{SP: Set point} \]
It sets the coldroom’s working temperature (see p. 10)
- Minimum: –45.0 *
- Maximum: 99 *
*(Depends on the bottom/top locking of the set point).

\[ \text{d0: Defrost frequency} \]
Time that must elapse between the starting of each defrost (see p. 12)

\[ \text{d1: Maximum defrost duration} \]
The defrost will end after this time has elapsed since it started.

\[ \text{F3: Fan status during defrost} \]
It defines the status of the fans during defrost. 0= Stopped 1= Running

\[ \text{A1: Maximum alarm probe 1} \]
Defines the temperature at which the maximum alarm will be triggered. Only affects probe 1.
- Minimum: –45.0 *
- Maximum: 99 *
*(Depends on the bottom/top locking of the set point).

\[ \text{A2: Minimum alarm probe 1} \]
Defines the temperature at which the minimum alarm will be triggered. Only affects probe 1.
- Minimum: –45.0 *
- Maximum: 99 *
*(Depends on the bottom/top locking of the set point).

\[ \text{P26: Stoppage owing to pump down} \]
It defines whether this function is active
- 0= Without pump down
- 1= With pump down
(see p. 14)
7.- Operation

7.1.- Compressor control

NORMAL OPERATION

If Pump Down is deactivated (P26=0), the compressor and the solenoid behave in the same way.

If Pump Down is activated (P26=1), the compressor and the solenoid behave as defined in section 7.5.

"CHANGE OF SET POINT" FUNCTION

It modifies the refrigerated facility’s set point value.

When the temperature in probe 1 reaches the set point value (SP) plus the differential of the probe (C1), the compressor and solenoid are activated and the temperature drops. When the set point value (SP) is reached, the compressor and solenoid stop.

It can be activated after a certain time has elapsed (defined in parameter C11) without activity in the cold room door, to do this one of the digital inputs such as "door contact" (P10 or P11 = 1) must be configured.

Optionally, you can activate and deactivate this mode at will, using an external switch, configuring one of the digital inputs as “Change set point” (P10 or P11 = 4).

If we set the C11 parameter to 0, it can only be activated by external switch.
COMPRESSOR PROTECTION DELAY

There are three types of delay, selectable by parameter C4, to protect the compressor. These delays prevent continuous compressor starts and stops due to sudden changes in temperature.

OFF-ON (C4=0): Minimum compressor OFF time before each start-up.
OFF-ON / ON-OFF (C4=1): Minimum time during which the compressor will remain ON and OFF in every cycle.

The delay time is defined by parameter C5.

OPERATION IN CASE OF PROBE 1 FAILURE

In the event of probe 1 failure (fault, disconnection, etc.) compressor performance will depend on C6 settings. Users may choose between 3 options:

C6=0: The compressor will be stopped until probe 1 is working again.
C6=1: The compressor will be operational until probe 1 is working again.
C6=2: The compressor will operate according to the average performance of the last 24 hours, taking into account the number of starts and stops and the average time in each state (stop-start).
C6=3: The compressor will run as scheduled in C7 (ON) and C8 (OFF).

SET POINT LOCKING

Using the C2 and C3 parameters, it is possible to set an upper and a lower limit for the Set point (SP), which precludes configuring a set point that is too low or too high that could damage the installation or the stored product.

STOP FANS AND COMPRESSOR WHEN THE DOOR IS OPENED

The P23 parameter defines whether the compressor and the evaporator fans stop when the cold room door is opened. To do so one of the digital inputs must be configured as “door contact” (P10 or P11=1) (See page 22). If the door stays open longer than the value programmed in the P24 parameter, the compressor and the fans will return to their normal operation.
7.2.- Defrost control

Defrost start-up
Defrost is initiated if:
- Time scheduled in parameter \(d0\) has passed since the beginning of last defrost.
- The \(N\) key is pressed for 5 seconds.

Defrost type
By resistors: The defrost resistors start up and the compressor stops; defrost is the result of heat from the resistors. Fans will be running or not depending on parameter \(F3\).

Drip time
Parameter \(d9\) sets drip time and the time added at the end of defrost cycle to allow for drainage of the remaining water in the evaporator. During this time the compressor and fans will not be running (unless defrost is by air).

Defrost termination
The defrost will terminate if:
- The temperature programmed in parameter \(d4\) has been reached in probe 2 Probe 2 must be activated (P4).
- In the event of probe 2 failure, defrosting will be complete once the maximum time has elapsed (\(d1\))
- Time set in parameter \(d1\) has passed (maximum duration of defrost).
- The \(H\) key is pressed for 5 seconds.

Message displayed during defrost
Set by parameter \(d2\), with the choice of showing the actual temperature detected by probe 1 (\(d2=0\)), displaying the temperature detected by probe 1 at the start of defrost (\(d2=1\)) or displaying the DEF message (\(d2=2\)). The \(d3\) parameter defines the time during which the message is displayed, once the drip time (\(d9\)) and the fan stop time (\(F4\)) is over.
Other parameters

Parameter \( d5 \) allows users to specify if the unit will (\( d5=1 \)) or will not (\( d5=0 \)) defrost when powered up (initial start-up or after a power failure). In case of choosing option YES (\( d5=1 \)), the defrost will start after the delay time specified in \( d6 \).

Using parameter \( d8 \), users define the computation of time in \( d0 \), choosing between total time elapsed (\( d8=0 \)) or the total compressor running time (\( d8=1 \)).

**NOTE:** If parameter \( d1 \) is set to 0, no defrost will be performed.

Remote defrost

This function allows activating the defrost of the unit using an external button, connecting it to one of the digital inputs that must be configured as “remote defrost” \( (P10 \, P11=6) \).

7.3.- Fan control

Fans are controlled with probe 2 (evaporator) and parameters \( F0 \) (shutdown temperature) and \( F1 \) (Probe differential). Even if probe 2 is not connected or an error is detected in the probe (E2), the fans will always run regardless of parameters \( F0 \) and \( F1 \), but taking into account parameters \( F2 \) to \( F5 \).

Parameter \( F2 \) defines the status of the fans during compressor stops.

Parameter \( F3 \) defines the status of fans during defrost.

Parameter \( F4 \) defines the fan start-up delay after defrost (see section 7.2).

7.4.- Condenser fan control

Condenser fan 1 is activated and deactivated at the same time as the compressor. Condenser fan 2 can be controlled by a high pressure switch.

They have no associated parameter.
7.5.- Pump down function

This function prevents compressor problems caused by movement of the refrigerant, using a stop/start technique of
the unit controlled by liquid solenoid, the low pressure switch and the compressor.
For this function to be active, it must be configured in parameter \( P26 = 1 \).

**PARO**

When the temperature in probe 1 reaches the set point (SP) value, the liquid solenoid closes.
Since the compressor is still running the evaporator pressure drops suddenly. When it reaches a specific point, the
low pressure switch is activated, changing the state of digital input 1, and the controller stops the compressor.
This manoeuvre isolates the refrigerant from the compressor crankcase, preventing serious damage on start-up.
In case of low pressure switch failure, the controller stops the compressor after the safety time set at \( P15 \), showing
the message “Pd”, but it will continue to function normally. (Informative message, does not affect the equipment
operation).
If time \( P15 \) is 0 (default value), the compressor will not stop until the low pressostat is activated, but it will display
the “Pd” message after 15 minutes.

**STARTUP**

When the temperature in probe 1 reaches the set point plus the differential (SP + C1) value, the liquid solenoid
opens. This increases the pressure in the evaporator, deactivating the low pressure switch, which turns the
compressor on.
If a period of time (determined by \( P14 \)) has elapsed after the liquid solenoid is opened, the low pressure switch
will not be deactivated, the controller will once again close the solenoid, and the “LP” message will be displayed.
This manoeuvre will be repeated every 2 minutes, indefinitely, until the pressure switch is deactivated and the
installation reverts to its normal operation.
If the time for \( P14 \) is 0 (default value), the solenoid will stay open until the low pressure switch is deactivated, but
after 3 minutes it will display the “LP” message.

**STAND-BY**

If the pump-down function is active, some time may elapse from the time the stand-by function starts until the
controller stops. This is because certain control phases of the system cannot be stopped.
7.6.- Alarms

The unit warns the user by displaying an on-screen message when the programmed criteria are met.

**Max/Min Temperature Alarm**

Shows the **AH** or **AL** message when the temperature in probe 1 reaches the value set in the **A1** (maximum temperature) or **A2** (low temperature) parameters.

This value can be:

- **Absolute (A0=1):** A1/A2 should indicate the temperature at which the alarm should be activated.
- **Relative to SP (A0=0):** A1/A2 should indicate the number of degrees above or below the set point at which the alarm is activated. This option allows users to adjust the set point without having to modify the high and low alarm settings.

Parameter **A10** sets the differentials for both parameters (hysteresis).

**Example**

In a controller we configure the following parameters: **SP**=2, **A1**=10, **A10**=2
- If A0=0 (relative to SP), the maximum temperature alarm goes off when probe 1 reaches 12 degrees and is disabled when it reaches 10 degrees.
- If A0=1 (absolute), the maximum temperature alarm goes off when probe 1 reaches 10 degrees and is disabled when it reaches 8 degrees.

In the case of configuring the alarms in relation to the **SP** (A0=0), the value set for the **SP** parameter is taken as a reference, even though the “CHANGE SET POINT” function may have been activated.

**External alarm/severe external alarm**

Displays the message **AE** (external alarm) or **AES** (severe external alarm), when the digital input configured as external alarm or severe external alarm is activated.

The severe external alarm also deactivates all the charges, therefore, the temperature regulation is stopped. When this alarm disappears the device returns to its normal operation.

At least one of the digital inputs must be configured as external alarm (**P10** or **P11**=2) or severe external alarm (**P10** or **P11**=3).

**Defrost alarm completed by time.**

Shows the **Adt** alarm message when a defrost terminates by time-out, if parameter **A8**=1.

**Door open alarm**

Displays the **PAb** message when the door stays open for a time greater than that set with parameter **A12**. (One of the digital inputs must be configured as door contact (**P10** or **P11**=1).

**Pump down malfunction error (Stop)**

Displays the **Pd** message if a malfunction is detected when the installation is stopped using the pump down manoeuvre. (See p. 14).
**Pump down malfunction error (Start up)**
Displays the LP message if a malfunction is detected when the installation is started up using the pump down manoeuvre. (See page 14).

**Compressor safety chain alarm**
The ASC message is displayed if any component in the compressor’s safety chain is triggered (compressor motor guard, thermistors or high pressure controller). Regulation is stopped until protection has been restored.

**Alarm delay**
These delays prevent the display of specific alarms while allowing the unit to recover normal operation after certain events.
- Start-up delays (A3): Delays activation of temperature alarms on power-up (start-up or after a power failure). This allows avoiding continuous alarms upon start-up.
- Delay after defrost (A4): Delays activation of temperature alarms post-defrost.
- Delay of max/min temperature alarm (A5): Delays activation of maximum (A1) and minimum (A2) temperature alarms from the moment temperature probe 1 reaches the set value.
- Delay of external alarm activation (A6): Delays the activation of the external alarm from the moment the digital input becomes active.
- Delay of external alarm deactivation (A7): Delays the deactivation of the external alarm from the moment the digital input becomes inactive.
- Door opening alarm relay (A12): Delays activation of the open door opening detection alarm.

**7.7. - Access code (password)**
It allows protecting the configuration of the unit using a 2 digit code (from 01 to 99). If it is active a code is requested when you try to access the programming menu. This menu cannot be accessed if a wrong value is entered. The code is defined using the L5 parameter.
Parameter P2 defines the operation of this code.
8.- Parameter transfer

This function allows transferring the programmed parameters from one device to others, using the AKO-D14918 programming key. This will save a lot of time when configuring similar devices.

Transfer parameters from the equipment to the key

- Connect the programming key in the parameter server connector.
- Press the READ key on the programming key.
- Disconnect the device programming key.

Transfer parameters from the key to the equipment

- Connect the programming key in the parameter server connector.
- Press the RECORD key for the programming key.
- Disconnect the device programming key.
9.- Advanced configuration

Using the advanced configuration menu, you can set **ALL** the equipment’s parameters. The parameters are grouped into 6 sections depending on their function. To access it, press the [ ] key for 10 seconds.

If the access code is activated, a 2 digit code is requested (See page 16), if the code entered is incorrect the unit will not enter programming mode.

To see the complete parameters list, refer to page 19.

After 20 seconds with no key being pressed, the equipment will return to the previous level. If you are on level 3, the changes will not be saved.

9.1.- Return to initial parameters

This function configures all the unit’s parameters to its default values, i.e., as it leaves the factory.

In order to return the computer to its initial settings, go to the programming menu and set parameter **P3** to 1. The computer will now restart with its factory settings.

**WARNING:** Any change made in the unit’s configuration will be lost.

9.2.- Program version

The **PU** and **Pr** settings allow the version and review of the firmware installed in the equipment to be displayed.

Use this information if you have to ask for advice from the technical assistance service.
9.3.- Parameters

The parameters are grouped into 6 sections depending on their function. To access it, press the key for 10 seconds.

The **Def.** column shows factory-set default parameters.

Temperature values are expressed in °C. (Equivalent temperature in °F)

10.- Technical specifications

- Rated voltage $U_{n}$: 400 V~ ±10 % 50/60 Hz ±5 %
- Rated voltage $U_e$: 230 V~ ±10 % 50/60 Hz ±5 %
- Maximum nominal input current: 32 A
- Short-circuit current at the connection point: 6 kV
- Probe temperature range: –45.0 ºC to 99.9 ºC
- Resolution, setting and differential: 0.1 ºC
- Thermometric precision: ± 1 ºC
- Precision of the NTC probe at 25 ºC: ± 0.4 ºC
- Input for NTC probe: AKO-14901
- Maximum input power in the operation: 30 VA
- Working ambient temperature: -5 ºC to 40 ºC
- Storage ambient temperature: -30 ºC to 70 ºC
- Overvoltage category: II s/ EN 61439-1
- Degree of pollution: II s/ EN 61439-1
- Degree of protection: IP65
- Dimensions
  - AKO-17632 / 17635 / 15720 / 15721: 400(An) x 300(Al) x 165(P) mm
  - AKO-17633 / 17634 / 17636 / 17637: 500(An) x 400(Al) x 175(P) mm
- Double isolation between power supply, secondary circuit and relay output.
- Type of assembly: Fixed internal
- Programming key compatible: AKO-D14918
- Encapsulated assembly
